

I fully support the assignment of the ITFS/MDS spectrum to extend the breadth of unlicensed spectrum. I personally have an 802.11 wireless network in my home along with 900Mhz and 5Ghz portable phones. The higher frequencies used in the 5Ghz phones seem to be more affected by the structure of my home and adversely affect the range of the phones. I had to remove my 2.4 Mhz phone because it and the 802.11 network interfered with each other. We the public, need more area to expand without interference. Thank you,
